Have fun, be creative, and have a lot of fun using Photoshop in the best way—to manipulate images! by David Tyree[The effect of indometacin, flufenamic acid and enprostil on human gastric pepsin secretion]. The influence of prostaglandins E1 and E2 on human gastric secretion in response to sham feeding were investigated in nine healthy volunteers. First, the intragastric pH was adjusted to a mean value of 2.9 +/- 0.1 during 4 h of fasting. Secondly, 10 micrograms/kg/h of indometacin, flufenamic acid or enprostil were infused into the duodenum for 2 h. Thirdly, 10 micrograms/kg/h of indometacin, flufenamic acid or enprostil were infused for 2 h. Pepsin and gastrin were measured by radioimmunoassay and DIP-pH was recorded at intervals. It was found that all three agents significantly decreased the pH of the duodenal juice from 2.8 +/- 0.1 to 2.4 +/- 0.1 (p less than 0.01) and 2.2 +/- 0.1 (p less than 0.001) and in the gastric juice from 1.5 +/- 0.1 to 1.1 +/- 0.1 (p less than 0.001) and 0.9 +/- 0.1 (p less than 0.001). It was found that all agents increased significantly the output of pepsin and the reduction in pH during the fasting period (p less than 0.01) and intragastric pH (p less than 0.05). The effects of prostaglandins E1 and E2 on pepsin secretion were not additive. It is concluded that the prostaglandins E1 and E2 inhibit basal gastric pepsin secretion.Q: SIGSEGV, Segmentation Fault I am new to multithreading and I am getting this error on the line in which the process_time(tid) is used. * **_Brushes_** —Brushes work in much the same way that pens do in other programs. You can use them to paint, sketch, create images, or blend two colors. * **_Pen_** —A pen works differently than a brush. You can make text, line art, or anything else with a pen. A pen uses a digital nib that creates lines or writing on its own. You can erase what you've written with a pen tool, unlike brushes, because there's no paint left behind. Pen tools are not as common in Photoshop as brushes. * **_Pens_** —Pens work in much the same way as pen tools, except that you can't erase what you've written or drawn. Instead, you start over again with a new pen tool. * **_Lasso_** —You can use a lasso to edit or erase parts of an image. The lasso tool is useful when you want to isolate a part of an image and then make changes, such as moving or enlarging it. * **_Polygon_** —You can use the polygon tool to create a simple shape or a complex shape (such as a star or animal). Polygon tools are useful for sketching on the screen or creating quick-and-dirty shapes for retouching images. * **_Eraser_** —An eraser allows you to remove unwanted portions of an image with precision. You can use an eraser to take off a piece of or fill a hole in an image, or even clean up an image in general. An eraser doesn't work the same way that a pen does. When you erase with an eraser, the image is not left behind. Instead, the removed portion of the image is replaced with empty space (which is transparent). * **_Smudge tool_** —A smudge tool works like a pen or brush. You can erase everything you've written with a smudge tool, but as with a pen, you can start over again with a new tool. * **_Dynamite tool_** —The dynamite tool lets you modify a section of an image and move it to any location on the canvas. This tool is useful when you want to select an area, perform a quick and dirty edit, and then move it to a new location. The bigger your image is, the longer it takes to move the dynamite tool around, so try it out on a small image first. * _

[3H]mazindol binding to neuropeptide Y Y1 receptors on human T lymphocytes: comparison of radioligand distribution in normal versus schizophrenic tissue. Neuropeptide Y (NPY) binding sites have been characterized in human T lymphocytes (CD3 cells) by autoradiographic [3H]mazindol and [125I]PYY binding studies. The density of [3H]mazindol binding was two- to three-fold greater in the CD3 cells when compared to the neuroblastoma B cell line, N1E-115. When T cells were incubated with either 100 nM [3H]mazindol or 10 nM [125I]PYY to label the respective NPY receptors, a comparison of receptor binding and localization revealed that [3H]mazindol, but not [125I]PYY, is preferentially bound to the plasma membrane of human T lymphocytes. This differential labeling pattern was confirmed by single- and double-labeling studies. The binding sites labeled by [3H]mazindol were restricted to the plasma membrane, as determined by light and electron microscopy, whereas [125I]PYY labeled internal and external structures. Consistent with a surface receptor, [3H]mazindol binding was inhibited by guanine nucleotides and guanine nucleotide analogs (GppNHp). This binding was totally prevented by NPY. Conversely, NPY inhibited [3H]mazindol binding to N1E-115 cells. Preincubation of T cell membranes with NPY antibodies prevented [3H]mazindol binding to membranes from both cell types. Immunohistochemical analysis demonstrated that T cells from normal human kidney contained high levels of NPY-like immunoreactivity (NPY-LI). In contrast, NPY-LI immunoreactivity was dramatically reduced in the T cells from human brains with schizophrenia. These results support the hypothesis that T cells are involved in the pathophysiology of schizophrenia and that NPY may be a contributing factor to the disease.
