In the chapter "Use of Anti-Bacterial Agents in Water Treatment," the. download book in pdf formatDue to development in a camera, which has been mounted on a mobile phone and so on, photo shooting has been performed in a hand-held manner. An auto-focusing (AF) sensor including an image sensor such as a CCD (Charge Coupled Device) or a CMOS (Complementary Metal-Oxide Semiconductor) sensor is mounted on an image capturing optical system. It is also proposed to mount an AF sensor on a flash. Meanwhile, in mobile shooting, a main subject is difficult to be correctly focused on the contrast AF with a phase difference detection method in many cases. In order to solve this problem, there is adopted a method in which focus is attempted by driving a focus lens by stepping drive or by a shake detection method. However, in case of a mobile terminal, a lens itself is miniaturized and thus it is difficult to miniaturize and inexpensively manufacture a driving mechanism for performing movement for driving a focusing lens. Therefore, in case of adopting the shake detection method for AF, a method in which a position detection is performed by the shake detection method with using a subject in a region where a focus is difficult to be obtained by the contrast AF, in addition to the contrast AF for focusing on a main subject, has been performed. The image capturing optical system for mobile phones has been miniaturized for the purpose of miniaturization of the camera itself. Therefore, a structure of a focus lens, which is a prime constituent component of the image capturing optical system, is also miniaturized. As a result, miniaturization of a focus lens drive mechanism becomes difficult. In addition, in order to detect a shake of a camera, a sensor itself is miniaturized in many cases
