The benefits of Photoshop are many, and there are entire books written on just Photoshop alone. However, one of the most basic of uses is to reduce the amount of files necessary for creating a video. Reducing the number of files in a project is crucial for people who want to get their projects done in time, but without driving up the cost of production through expensive file storage. When working on a video, one often needs to create multiple different versions of the same video. This helps the director make sure the different versions can be used for different purposes. If you're the director or producer of a video, or are the director's assistant, it's important to have the ability to do as many edits as possible on a project before it's locked down for final production. The ability to create alternative versions of a project with minimal effort allows for fewer projects to be brought in on set, and for faster production schedules. When scheduling a client's project, the amount of time and manpower required to pull together all of the project's version files is significant and a drag on a project's budget. Photoshop can be used to make a lot of different edits to a video or a still. The most basic way to do this would be to place a layer on top of the video or still. This layer can then be edited in any way desired. With the number of layers possible with Photoshop, the number of edits one can make to a project is nearly endless. Photoshop has many features that can be used to create different versions of a project. These features include Layers, Selections, and Gradients. Photoshop's Layers allow for different parts of a video or a still to be isolated, manipulated, and deleted. This feature is great for people trying to figure out what's in a video and how to get rid of the parts that aren't necessary. Selections are another way to isolate parts of a video or a still. Selections are more complicated than layers, but they can achieve similar results. They can be thought of as a regular layer that holds information about the areas that make up that layer. Gradients are the biggest shortcut that will be covered in this

tutorial. By placing a gradient on a layer in Photoshop, you can affect the colors of the area that the gradient covers. In this tutorial, we are going to create a simple overlay to edit parts of a video that we have already edited in Final

Q: When should I use a List, Dictionary, ArrayList, or Vector? My textbook, Linear Algebra by Golan teaches that a vector is a thing we're taught to use. Then it gives you a simple example where you make a vector  $v$  out of the numbers  $x_1, x_2, x_3$  and then uses it as a sort of index for a dictionary of words. Then the book gives a question that asks if the a dictionary can be implemented by a vector.  $v = \langle 1, 2, 2 \rangle$  A dictionary  $D = \{\text{word}_1, \text{word}_2, \text{word}_3\}$  Question: Define a set of functions  $f_i$  that map the domain  $\{w_1, w_2, w_3\}$  to the range  $\{1, 2, 3\}$ , that is,  $f_i: D \rightarrow \{1, 2, 3\}$ ,  $i=1, 2, 3$ , and by reflecting on this set of functions, construct the function  $g: D \rightarrow \{v_1, v_2, v_3\}$  that maps the domain  $\{w_1, w_2, w_3\}$  to the range  $\{1, 2, 2\}$ , that is,  $g: D \rightarrow \{v_1, v_2, v_3\}$ ,  $i=1, 2, 3$ , where  $v_i = g(w_i)$  for  $i=1, 2, 3$ . We are supposed to solve this question by using a set of functions  $f_i$  to construct the function  $g$ . I understand that using a set of functions is the reason we have vector and Dictionary and ArrayList, but this would mean that a vector is better than a dictionary! Does this make sense? Then the textbook says "If the question was: Make a dictionary  $D = \{\text{word}_1, \text{word}_2, \text{word}_3\}$  that maps the domain  $\{w_1, w_2, w_3\}$  to the range  $\{1, 2, 2\}$ , then you can just use a list of functions, such as the one below: It says that using a list of functions is equivalent to using

Evaluation of the effects of thyroxine and dexamethasone on blood pressure and electrolytes in infancy. In order to elucidate the effects of thyroxine (T4) and dexamethasone (D) on blood pressure and body fluids in infancy, we studied the responses of blood pressure and electrolytes (Na<sup>+</sup>, K<sup>+</sup>, Cl<sup>-</sup>) to D (1 mg/kg/d for 5 d) and/or T4 (14 micrograms/kg/d for 4 wk) in 77 infants (29 days to 6 mo old) and in 10 prepubertal (4.6- to 13.5-yr-old) children. In both groups, the systolic and diastolic blood pressures and the levels of Na<sup>+</sup>, K<sup>+</sup> and Cl<sup>-</sup> in plasma and the Na<sup>+</sup> and Cl<sup>-</sup> in urine and the Cl<sup>-</sup> in the whole body water significantly increased significantly after D administration. These responses were more prominent in infants compared with prepubertal children. The total body water, extracellular fluid (ECF) and intracellular fluid (ICF) significantly increased after T4 administration in the infants. ECF/ICF significantly decreased after D administration and/or the ingestion of T4. The administration of T4 increased plasma volume and the levels of Na<sup>+</sup> and Cl<sup>-</sup> in plasma and urine, and total body water. These responses were greater in infants compared with prepubertal children. The rise in blood pressure and the plasma volume appeared to be more marked in infants than in prepubertal children. After the withdrawal of T4, a rapid decrease in the systolic blood pressure, plasma volume and Na<sup>+</sup> and Cl<sup>-</sup> levels in plasma and urine, and ECF and ICF volumes occurred. These responses were faster in infants than in prepubertal children. The responses of body fluid, Na<sup>+</sup> and Cl<sup>-</sup> levels in plasma and urine and the ECF and ICF volumes to D were greater in the presence of the administration of T4. In the absence of T4, the concentrations of Na<sup>+</sup> and Cl<sup>-</sup> in plasma and urine decreased. These responses were faster in prepubertal children. The following conclusions were

obtained. The responses to T4 and D in infants may be related to maturation. The greater ECF/ICF ratio with D may be more associated with the process of fluid loss through the intestinal tract as compared with prepubertal children.Q: Make
